
(a) The metric AND the pulse bound decide the answer
(N=400, shared noise parameters)
T_2, matched f_{01}
T_2, raw
gate count, $1/f_{01}$ bound
gate count, $1/|\alpha|$ bound
parity
samples
fluxonium / transmon
(b) The old $N = 60$ interval
was not converged
raw T2
T2 at matched f01 = 1 GHz
superseded
N=60
90% CI width on the median (%)
Monte Carlo samples N
(c) Median and 5–95% spread
the pulse bound moves the answer more than the noise band does
shared
independent
fluxonium / transmon
raw T_2
matched T_2
gate matched $1/|a|$
gate own $1/|a|$
gate own min
gate own $1/f_{01}$
gate matched $1/f_{01}$
