
(a) Linear sampling cannot see the sweet spot
only 2 of 60 points below 2 × 10^−3
window where
flux dephasing
dominates
log-spaced (notebook 03), 60 pts
linear-spaced (superseded), 60 pts
T2 (µs)
detuning ΔΦ/Φ0
(b) The exponent is not a constant
it reaches −1 only where the theory applies
fitted exponent k in T2 ∝ ΔΦ^k
superseded single fit, k = −0.68
first-order 1/f theory, k = −1
